Social Matters CRM

Multi-Client Lead Management & Advertising Analytics

Product	Version	Status
Social Matters CRM	1.0 — MVP	Scope defined

An internal agency platform that centralizes leads from advertising and marketing channels, gives each client a secure workspace, and connects campaign performance with lead outcomes.

Prepared for Social Matters

1. Executive Summary

Social Matters CRM is a centralized lead management and advertising analytics platform designed to collect, organize, track, and report leads generated through multiple advertising platforms for different clients.

The system provides Social Matters with a centralized view of client activity while maintaining strict data separation. Each client has an independent dashboard where its team can access leads, manage follow-ups, update statuses, record conversions, and monitor campaign performance.

Core principle: Simple to use, easy to scale, and focused on lead management rather than unnecessary CRM complexity.

2. Product Objectives

- Centralize leads from supported advertising and marketing platforms.
- Maintain a separate workspace for every client.
- Eliminate manual lead downloads and spreadsheet sharing.
- Provide clients with secure access to their own leads.
- Allow clients to manage their sales pipeline without modifying original lead data.
- Track lead status, follow-ups, conversions, and revenue.
- Display advertising performance alongside lead performance.
- Provide real-time notifications for new leads and important activities.
- Give Social Matters a consolidated view of all clients.
- Build a scalable architecture that supports future integrations and features.

3. Scope

In Scope — V1

- Multi-client management and role-based access.
- Meta, Google, LinkedIn, website, and WhatsApp lead collection.
- Custom website forms and webhook integration.
- Automatic lead synchronization and dynamic lead form fields.
- Lead management, status tracking, notes, and follow-up reminders.
- Duplicate detection, conversion and revenue tracking.
- Client portal and user management.
- In-app and browser notifications.
- Lead exports, campaign performance analytics, dashboards, and reporting.

Out of Scope — Initial Release

- AI lead scoring; automated WhatsApp marketing campaigns; built-in telephony.
- Advanced sales automation; invoicing and accounting; HR management.
- AI chatbot; complex workflow builder; native mobile applications.

4. User Roles and Permissions

Default Roles

Role	Permissions
Super Admin	Create, edit, and deactivate clients; manage agency users; view all client leads and dashboards; configure integrations; manage roles; view consolidated analytics; export reports; manage platform settings.
Agency Account Manager	View assigned clients; monitor leads and campaign performance; view client dashboards and reports; monitor integration health; receive notifications. Cannot assign leads or edit original lead information.
Client Admin	View all leads for their organization; create and manage client users; change statuses; add notes and follow-up dates; mark conversions; export leads; view campaign analytics; manage notification preferences. Cannot modify original lead information.
Client Sales User	View leads permitted by role; update statuses; add notes; schedule follow-ups; mark conversions; use call and WhatsApp shortcuts; receive notifications. Cannot manage users or integrations.

Super Admin should be able to create custom roles by enabling or disabling permissions such as viewing all or assigned leads, changing status, adding notes, managing follow-ups, recording conversions, exporting, viewing analytics, managing users, and managing integrations.

Important: Agency employees will not assign individual leads to clients or their sales teams. Lead distribution within a client organization is managed by the client.

5. Client and Workspace Management

Every client has an independent workspace containing its profile, lead database, connected advertising accounts, website form integrations, client users, campaign performance, notifications, reports, and settings.

Data isolation is mandatory: clients must never access another client's records; agency users may access only clients permitted by their roles; and all exports must enforce the same permissions as the dashboard.

6. Lead Collection and Integrations

Source	V1 Requirements
Meta — Facebook & Instagram Lead Ads	Instant Forms, automatic synchronization, campaign/ad set/ad details, form questions and responses.
Google Ads Lead Forms	Lead submissions, campaign information, form responses, and source identification.
LinkedIn Lead Gen Forms	Lead form submissions, campaign attribution, contact details, and custom answers.
WhatsApp	Capture inbound enquiries through supported WhatsApp Business API integrations; store phone and message details; associate enquiries with the correct client.
Website Forms	CRM-hosted and embeddable forms, API/webhook integration, custom fields, and UTM tracking.
Manual Entry	Create leads manually, select client and source, enter contact details and custom fields.

Integration availability and specific data fields depend on each platform's API permissions, account eligibility, and supported endpoints.

Integration Management

- Connect advertising accounts and associate them with clients.
- Select available pages, forms, and ad accounts.
- Enable or disable synchronization.
- View connection status and last successful sync.
- Retry failed synchronization and inspect error logs.

Status	Meaning
Connected	Working normally
Syncing	Data is being fetched
Error	Synchronization failed
Disconnected	Authorization expired or removed

7. Dynamic Lead Form Fields

The CRM automatically stores all submitted form responses, including fields not predefined in the CRM. Leads must not be rejected or lose data because a form contains additional fields.

Example Field	Example Value
Full Name	Rahul Reddy
Phone	9876543210
Email	rahul@example.com
City	Hyderabad
Interested Product	Gold Necklace
Budget	■1,00,000
Preferred Visit Date	10 October
Custom Question	Interested in wedding collection

Lead details should separate contact information, original form responses, lead source, and editable CRM management fields. Original data is read-only; CRM fields remain editable according to permissions.

8. Lead Management

Lead Lifecycle

New → Contacted → Interested → Follow-up → Converted or Lost

Authorized client users can change statuses. The system records status history, including the user and timestamp.

Lead List

Column	Description
Lead ID	Unique identifier
Name / Phone	Original contact information
Source / Campaign	Origin and campaign
Status	Current lead status
Follow-up	Scheduled date
Created At	Submission time
Actions	View, call, WhatsApp

Filters: client, date range, source, campaign, status, assigned client sales user, follow-up date, conversion status, and search by name, phone, or email. Include pagination, sorting, bulk export, and mobile-friendly list/card views.

9. Original Data Protection

Original lead information must be immutable after ingestion.

Locked Fields

- Name, phone number, and email.
- Original form responses and submission timestamp.
- Source platform and campaign, ad set, and ad IDs/names.

Editable CRM Fields

- Lead status, notes, follow-up date, tags (if enabled), conversion value/date, and internal activity records.

If contact information is incorrect, users cannot overwrite the original. They may add a note describing the correction. Changes to CRM-managed fields must be auditable.

10. Duplicate Lead Management

Recommended model: Contact + Enquiry. A contact profile can have multiple enquiries. Phone number is the primary matching identifier; email is a secondary identifier.

- When a matching contact exists, create a new enquiry under that contact.
- Never discard a new submission; preserve its form data and campaign attribution.
- Show a duplicate indicator and allow authorized users to review contact history.
- Use appropriate unique constraints on external platform lead IDs to prevent duplicate ingestion.

11. Notes and Follow-up Management

Notes

Users can add multiple notes to a lead. Each note stores content, author, date/time, and associated lead. Notes are append-only for ordinary users; restricted edits/deletions must be recorded in the audit log.

Follow-ups

Each lead can have a follow-up date, time, optional reminder note, and status: Pending, Completed, or Overdue. Dashboards show follow-ups due today, upcoming, overdue, and completed. Users receive in-app and browser reminders.

12. Conversion and Revenue Tracking

When a lead is converted, an authorized user records conversion date, value, and optional notes. Conversion data feeds client and agency dashboards, campaign/source reports, revenue reports, and ROAS calculations.

For repeat purchases, support additional conversion events without overwriting the original enquiry. Prevent the same conversion value from being counted multiple times.

13. Campaign Analytics and Performance

Metric	Definition
Spend	Total advertising expenditure
Impressions	Total ad impressions
Reach	Unique people reached
Clicks	Ad clicks
CTR	Click-through rate
CPC	Cost per click
CPM	Cost per 1,000 impressions
Leads	Total enquiries generated
CPL	Cost per lead
Contacted / Converted	Lead outcomes
Conversion Rate	Converted enquiries divided by eligible enquiries
Revenue	Recorded conversion value
ROAS	Attributed revenue divided by ad spend

Metrics should be filterable by date, client, platform, campaign, ad set, and ad, where supported. Users can drill down through **Client** → **Platform** → **Campaign** → **Ad Set** → **Ad** → **Leads**.

Preserve source and campaign information attached to each enquiry. Attribute recorded conversion values to the relevant enquiry, avoid double-counting, and clearly distinguish platform-reported conversions from CRM-recorded conversions.

14. Notifications

Notifications are mandatory for V1. Supported channels are in-app notifications and browser notifications. Email and WhatsApp notifications may be added later without changing the notification architecture.

- New lead received; follow-up due or overdue; lead converted; integration errors.
- New lead recipients: relevant Social Matters agency users, Client Admin, and client sales users.
- Users can enable/disable browser notifications, mark notifications read, view history, and navigate to the related lead.

- Retain notifications even if browser permission is unavailable.

15. Website Form Builder

Provide a simple form builder so Social Matters can create client forms without custom development for each form.

- Form name and client selection.
- Text, email, phone, number, dropdown, radio, checkbox, and textarea fields.
- Required/optional settings, custom labels, submit button, thank-you message, and basic styling.
- Spam protection and submission history.
- Publish through embed code, hosted form URL, or API/webhook endpoint.
- Each submission creates an enquiry in the correct client workspace and captures available UTM parameters.

16. Client and Agency Dashboards

Agency Dashboard

- Overall performance, client comparison, lead trends, platform performance, conversion trends, integration health, recent activity, follow-up overview, and quick client access.

Client Dashboard

- Total, new, contacted, interested, follow-up, converted, and lost leads.
- Conversion value, campaign performance, source distribution, recent leads, upcoming follow-ups, and notifications.

All metrics respect the selected date range and the user's authorized client scope.

17. Export and Reporting

Support CSV and Excel exports. Export filters include date range, status, source, campaign, assigned sales user, and conversion status. Include permitted lead fields, original form answers, and relevant campaign details.

- Lead summary report; campaign performance report; platform comparison report.
- Conversion report; revenue report; follow-up report; client activity report.

V1 reports are generated on demand. Scheduled email reports are a future enhancement.

18. Main Application Screens

Agency Portal	Client Portal
Login	Login
Dashboard	Dashboard
Clients	Leads
Client Overview	Lead Details
Leads	Follow-ups
Campaign Analytics	Campaigns
Reports	Reports
Integrations	Users
Users	Notifications
Roles & Permissions	Settings
Notifications	
Settings	

19. Database Architecture

Recommended: MySQL with Prisma ORM and a multi-tenant data model.

Table	Purpose
organizations	Client and agency organizations
users	User accounts
roles / permissions	Role definitions and individual permissions
role_permissions / user_roles	Permission and role mappings
client_assignments	Agency user-to-client relationships
contacts	Unique contact profiles
leads	Individual enquiries
lead_field_values	Dynamic form answers
lead_notes	Notes and comments
lead_status_history	Status change history
follow_ups	Follow-up schedules
conversions	Conversion and revenue records
lead_sources	Platform/source definitions
integrations	Connected accounts
integration_sync_logs	Sync status and error logs
campaigns / ad_sets / ads	Advertising hierarchy

Table	Purpose
ad_metrics	Daily advertising performance
forms / form_fields	Form configurations
form_submissions	Submitted form responses
notifications	User notification records
audit_logs	Record of important actions

Database Rules

- Every client-owned record contains an organization ID.
- Every lead retains its original source reference.
- Dynamic form answers support different data types.
- Store original lead data separately from editable CRM metadata.
- Use transactions for ingestion and duplicate matching.
- Use scoped unique constraints for external lead IDs.
- Preserve historical campaign data after external deletion or renaming.
- Use soft deletion for important records and maintain audit logs.

20. Recommended Technology Stack

Layer	Technology	Purpose
Frontend	Next.js + React + TypeScript	Responsive user interface
UI	Tailwind CSS + shadcn/ui	Consistent dashboard components
Backend	Node.js + NestJS	API and business logic
Database	MySQL 8	Persistent storage
ORM	Prisma	Database access and migrations
Authentication	Secure session/JWT strategy	Authentication and authorization
Background jobs	Redis + BullMQ	Sync and scheduled tasks
API	REST	Frontend and integrations
Forms	React Hook Form + Zod	Dynamic form validation
Charts	Recharts	Analytics
Storage	S3-compatible storage	Exports and files
Deployment	Docker	Application deployment
Proxy	Nginx or Traefik	Routing and HTTPS
Monitoring	Error tracking + structured logs	Reliability

Start with a **modular monolith**, not microservices. A single application with background workers keeps deployment and maintenance manageable while allowing modules to evolve.

21. Security and Reliability Requirements

- Secure password hashing and backend role-based access control.
- Strict tenant isolation and HTTPS.
- Rate limiting for authentication and public forms.
- Protection against common web vulnerabilities.
- Secure storage and refresh of API credentials/tokens.
- Audit logs, regular backups, and documented recovery procedures.
- Error logging, retry mechanism, and idempotent webhook processing.
- Pagination for large datasets; export permissions and audit trails.
- Configurable retention and deletion policies.

Collect only information necessary for lead management and reporting. Review client-specific data access, consent requirements, and applicable Indian data protection obligations before launch.

22. Non-Functional Requirements

Requirement	Initial Target
Availability	Target 99.5% monthly uptime
Dashboard loading	Under 3 seconds for typical views
Lead ingestion	Near real-time where source APIs support it
Scalability	Support multiple clients and large lead volumes
Responsiveness	Desktop, tablet, and mobile
Data isolation	Mandatory at every API and database access layer
Recovery	Automated backups and documented restore procedure
Reliability	Retry failed jobs without duplicate leads
Maintainability	Modular code and documented APIs

These are initial product targets and should be validated against hosting budget and expected usage.

23. MVP Development Roadmap

Phase	Deliverables
1 — Foundation	Authentication, organizations/clients, permissions, agency/client dashboards, database structure, navigation.
2 — Core Lead CRM	Lead list/detail, contact-enquiry model, dynamic fields, statuses, notes, follow-ups, duplicate detection, conversions, exports.
3 — Lead Integrations	Meta, Google, LinkedIn, website form builder, API/webhooks, WhatsApp enquiry integration, logs and retries.
4 — Analytics & Notifications	Ad performance sync, campaign/ad set/ad reporting, conversion/revenue reports, in-app/browser notifications, dashboards.
5 — Testing & Launch	Permission and tenant isolation testing, integration reliability, duplicate testing, performance testing, backup validation, onboarding, deployment.

24. Acceptance Criteria

- Super Admin can create and manage multiple clients.
- Clients access only their own workspace; client admins can manage client users.
- Agency users access only assigned clients.
- Supported platforms deliver leads to the correct workspace.
- All submitted form answers are retained, including custom fields.
- Ordinary users cannot edit original lead information.
- Clients can change status, add notes, schedule follow-ups, and record conversions.
- Duplicate submissions remain separate enquiries linked to the same contact when matched.
- Source and campaign attribution are preserved.
- Supported campaign metrics are visible at the appropriate levels.
- Conversion values feed revenue and ROAS reports.
- New leads trigger in-app and browser notifications for configured recipients.
- Follow-up reminders are visible and generate notifications.
- Authorized users can export filtered leads.
- Failed integration jobs can be inspected and retried.
- Tenant isolation and permission tests pass.
- The CRM works on desktop and mobile browsers.

25. Future Enhancements

Feature	Potential Benefit
WhatsApp automation	Automated lead acknowledgement and follow-ups
AI lead summaries	Summarize enquiry history
Lead scoring	Prioritize enquiries using configurable rules
Advanced sales pipelines	More detailed sales stages
Automated lead assignment	Distribute leads within client teams
Scheduled reports	Send weekly/monthly reports
Conversion API integration	Send qualified lead and conversion events back to ad platforms
AI insights	Identify campaign performance trends
Mobile app	Dedicated client and sales experience
Custom dashboards	User-configurable reporting

26. Final Product Definition

Social Matters CRM — One platform. Every client. Every lead. Every campaign.

For Social Matters: A centralized system to monitor client leads, advertising performance, conversions, and integrations.

For Clients: A simple workspace to manage enquiries, track follow-ups, record sales, and measure campaign outcomes.

For the Business: A scalable foundation that reduces manual reporting, improves lead visibility, and connects marketing activity with actual business results.

Final recommendation: Freeze the V1 scope around the features defined in this PRD. Build the core lead management and tenant architecture first, then connect advertising integrations and analytics. This will help Social Matters launch a useful product without getting stuck building an overly complicated CRM.
